SUMMARY

Senior Frontend Engineer with commercial experience building workflow-heavy product interfaces and the systems that support them, primarily with React, TypeScript and JavaScript. My work includes permission-aware administration tools, data-intensive configuration screens, shared component systems and API-backed workflows.

Throughout my career, I've worked closely with product and design to turn complex requirements into practical software while improving frontend architecture, developer tooling, testing and delivery workflows. More recently, I've been building the native iOS app for Alfred, an AI-backed planning product, and sharing technical decisions with the engineer who built its .NET backend and web client.

I naturally gravitate towards recurring sources of friction: unclear workflows, repeated manual steps and systems that are harder to change than they need to be. I enjoy making those systems clearer, more maintainable and easier for people to use and build.

CORE SKILLS

Frontend Engineering: React • TypeScript • JavaScript • HTML • CSS • Native iOS (Swift, SwiftUI) • Component Systems • State Management • Frontend Architecture

Product & Workflow Engineering: Technical Discovery • User Workflow Design • Design & UX Collaboration (Figma) • REST API Integration • Agile/Scrum • Backlog & Roadmap Ownership

Developer Experience, Tooling & Quality: Developer Tooling • Workflow Automation • Node.js Tooling • CI/CD & Release Automation • AI-Assisted Engineering (Claude, Codex) • Code Quality & Engineering Standards • Technical Debt Reduction • Technical Migrations • Testing

Technical Leadership: Technical Direction • Mentoring & Cross-team Support • Onboarding & Documentation

PROFESSIONAL EXPERIENCE

Product Engineer & Co-creator | Independent Product Project | 01/2026 – Present

Building Alfred, an AI-powered activity recommendation and planning product, with another engineer under our independent venture, Chaotic Focus. The product spans a C#/.NET backend with an asynchronous LLM enrichment pipeline, a native iOS application and a React/TypeScript web client and dashboard. I lead development of the iOS application, while my co-creator built the backend and web client, and we collaborate on architecture, testing, integration and product direction across the three systems. We use AI-assisted development, with the output reviewed through testing and architectural validation. The application is currently undergoing private TestFlight validation ahead of its first public release.

- Built the native iOS application, delivering the first end-to-end mobile experience across onboarding, authentication, recommendations and planning workflows.
- Shared technical and product decisions with the backend engineer, including decisions that shaped both the client and the server.
- Designed the iOS application's layered architecture using MVVM-style presentation, repositories, use cases and dependency injection.
- Built iOS platform features including widgets, CarPlay, voice capture, push notifications, location and maps, and Sign in with Apple.
- Integrated backend services for authentication, real-time updates, deep linking and application state while maintaining clear boundaries between networking, domain logic and presentation.
- Added automated tests across the presentation, domain, data and infrastructure layers.
- Managed the project's planning and delivery with Notion and Trello, keeping meeting notes and running weekly one-to-ones to align priorities and decisions.

Tech: Swift • SwiftUI • WidgetKit • REST APIs • SignalR • Firebase • XCTest • XcodeGen • GitHub • GitLab

Career Break

11/2024 – 12/2025

Took a career break after leaving The Signal Group.

Senior Frontend Software Engineer | The Signal Group | London, UK

12/2023 – 10/2024

Worked on Signal Ocean, a maritime intelligence platform used by brokers, operators and analysts to monitor global shipping activity. As part of a cross-functional product team, I worked on the Vessel List area within a large fullstack monorepo. One recurring challenge was that creating reusable Vessel List templates required support requests and manual engineering work. We redesigned that workflow into a self-service experience that allowed company administrators to create and manage templates directly.

- Developed the frontend implementation of the Template Admin experience, taking the feature through implementation, testing, fixes and production release, including permission-aware creation, editing, validation and deletion flows integrated with frontend state and metadata-driven APIs.
- Built data-intensive Vessels List configuration workflows using AG Grid, including role-based editing, validation, read-only and deletion states, and reusable editing behaviours.
- Maintained shared UI components across dashboards, forms and administration surfaces, including migrations away from deprecated components.
- Addressed type, lint, SonarLint and refactoring issues during frontend feature development.
- Onboarded a frontend engineer to the monorepo, Vessel List architecture and Azure-based development environment.

Tech: React • TypeScript • MobX • OpenLayers • AG Grid • C# • .NET • Azure DevOps • REST APIs

Frontend Tech Lead | Bally's Interactive | London, UK

11/2022 – 11/2023

Joined Gamesys as a Frontend Developer and progressed to Senior Frontend Engineer and then Frontend Tech Lead, remaining with the business through its 2021 acquisition by Bally's Corporation. Over time, my work expanded from customer-facing development into maintaining a configuration-driven promotional UI framework and the authoring, preview, deployment and engineering tooling around it, alongside frontend architecture and technical direction.

Provided technical direction across frontend initiatives focused on code quality, developer experience, onboarding and platform modernisation. Worked with Product, Technical Architects and engineering teams to improve frontend architecture, engineering standards and delivery practices across multiple products.

- Mapped dependencies and technical debt across the BMC reward-component architecture, identifying duplicated logic, legacy constraints and reusable abstractions to guide modernisation.
- Defined a frontend code-quality standardisation programme covering 13 frameworks, tools and shared libraries across 29 repositories, introducing consistent linting, formatting, commit validation, Pull Request automation and static analysis.
- Integrated SonarQube with GitHub Actions and Pull Request decoration, investigating monorepo test-reporting issues affecting quality-gate adoption.
- Created a structured onboarding programme covering repositories, architecture, production workflows and developer setup, including automated repository discovery through Confluence.
- Owned the Scrum backlog and roadmap, providing technical direction during planning, refinement and delivery while defining technical stories to prioritise platform improvements alongside product work.

Tech: React • TypeScript • Redux Toolkit • Nx • GitHub Actions • SonarQube • Jenkins • Storybook • Node.js • GitHub Enterprise REST APIs

Senior Frontend Engineer | Gamesys / Bally's Interactive | London, UK 10/2020 – 11/2022

Worked across customer-facing products and internal engineering tooling, increasingly focusing on developer experience, workflow automation and frontend platform improvements.

- Built a React preview application for validating generated promotional UI against real configuration before release, and maintained shared configuration infrastructure used by multiple delivery tools.
- Built a Node.js tool around the Jira REST API that reduced a promotional content workflow from days to minutes.
- Created a Node.js CLI that generated version-pinned promotional UI from templates and automated pull-request-based delivery; migrated it to TypeScript and introduced supporting CI and release practices.
- Created onboarding guides, architecture documentation and dependency maps that helped engineers understand large projects more quickly.

Tech: React • JavaScript • Styled-components • Node.js • Redux • GitHub REST API • Jenkins • Jira REST API

Frontend Developer | Gamesys | London, UK 03/2019 – 09/2020

Joined the Promotions team building customer-facing promotional experiences before expanding into frontend architecture, developer tooling and cross-team enablement.

- Led the technical improvement initiative for Landing Pages, defining the proposed frontend architecture, documenting the roadmap and presenting the approach to engineering, QA, design and business stakeholders.
- Contributed to a configuration-driven promotional UI framework and reusable components used across multiple consumer brands, helping non-engineers compose and deliver promotional experiences without changing application code.
- Built reusable components and styling foundations to improve consistency across promotional interfaces, and contributed to customer-facing React applications while helping improve internal engineering tooling and workflows.
- Mentored developers, designers and stakeholders through code reviews, frontend debugging, Git support and technical documentation.

Tech: React • JavaScript • Redux • Webpack • Sass • Node.js

Co-founder & Frontend Developer | UNBOX Design Studio | Brazil

10/2009 – 03/2017

Co-founded a technology and design studio delivering digital learning platforms, Learning Management Systems (LMS) and interactive educational products for Fortune 500 and global enterprise clients, including Volvo Brasil, Grupo Boticário, MetLife, HSBC and Electrolux. Worked across product discovery, solution design, technical leadership, frontend development and client delivery as part of a founding team comprising a computer engineer, a UX designer and a graphic designer.

- Worked directly with clients, designers and instructional specialists to translate business and learning requirements into practical software solutions.
- Led technical delivery of client projects, coordinating a team of up to five developers while remaining hands-on with architecture, frontend development and implementation.
- Reduced e-learning delivery time from around three months to about four weeks by building a JSFL script that extracted copy, content and images directly from the Flash design source files into dynamic, XML-driven content, replacing what had been a manual conversion step.

Tech: JavaScript • HTML • CSS • ActionScript • Moodle

EDUCATION

Computer Engineering (incomplete)

2005 – 2010

Positivo University, Brazil

Electronics

1997 – 2000

Federal University of Technology (UTFPR), Brazil
